

Create an application which will show the weather information for a specific city.

Users should be able to get the weather information for any valid cities.

### Screenshot:

<https://api.openweathermap.org/data/2.5/weather?q=Mumbai&units=metric&appid=7e3f21edee540e6110af347b55eb1ab2>

#### Checkpoint 1:

##### HTML Structure:

- Create the search bar on header
- Create the section to show city and date(fill out dummy values)
- Create another section to show main temperature (Fill with dummy values)
- Create a section to show weather (Fill with dummy values)
- Create a section to show hi/low temperature (Fill with dummy values)

#### Checkpoint 2:

##### CSS:

- Create CSS File and link it with html
- Create css classes/id and properties inside of the css file to make sure the look and feel of the app should be like as shown in screenshot or video
- And Take Background image from the drive

Checkpoint 2:

JS:

Create JsFile and link it with html

Logic to hit the api as user is hitting enter in the search box

Show the details of api and using dom update the values in html

weather.name -> city

weather.sys.country -> country

weather.main.temp -> temperature

weather.main.temp\_min -> min temperature

weather.main.temp\_max -> max temperature

weather.weather[0].main -> Weather

Take the today's date and format it as per the screenshot shown
